

SIMULATED ANNEALING

Brandon Lyons

Tyler Herd

OUTLINE

- ▶ Traditional Descent
- ▶ Problems with Traditional Descent
- ▶ Introduction to Simulated Annealing
- ▶ General Annealing
- ▶ Key points
- ▶ Algorithm
- ▶ Uses
- ▶ Traveling Salesperson
- ▶ TSP Uses

TRADITIONAL DESCENT

- ▶ Randomly select initial state
- ▶ Iterate through solutions
- ▶ Find extremes through iteration
 - ▶ Steepest Descent
 - ▶ Random Descent
- ▶ Minimums or Maximums

FOR EXAMPLE

BUT WHAT ABOUT?

TO CLARIFY

- ▶ You need to find the highest hill
- ▶ But there is a dense fog

How do you know you are there?

LOCAL EXTREMA

Traditional descent stops at local extremes

SOLUTION

- ▶ Simulated Annealing
- ▶ Genetic Algorithm
- ▶ Ant Colony Algorithm
- ▶ ...

SIMULATED ANNEALING

- ▶ Basic idea comes from metallurgy
- ▶ Very similar to Traditional Descent

BASIC IDEA OF ANNEALING

- ▶ Solid > Melting point > Solid
- ▶ Structural properties of the cooled solid depends on the rate of cooling

KEY POINTS

- ▶ Temperature decreases over time
- ▶ Temperature continues to decrease until the system “freezes” into a steady state

Thermodynamic simulation	Combinatorial optimization
System states Energy Change of state Temperature Frozen State	Feasible solutions Cost Neighboring solution Control parameter Heuristic solution

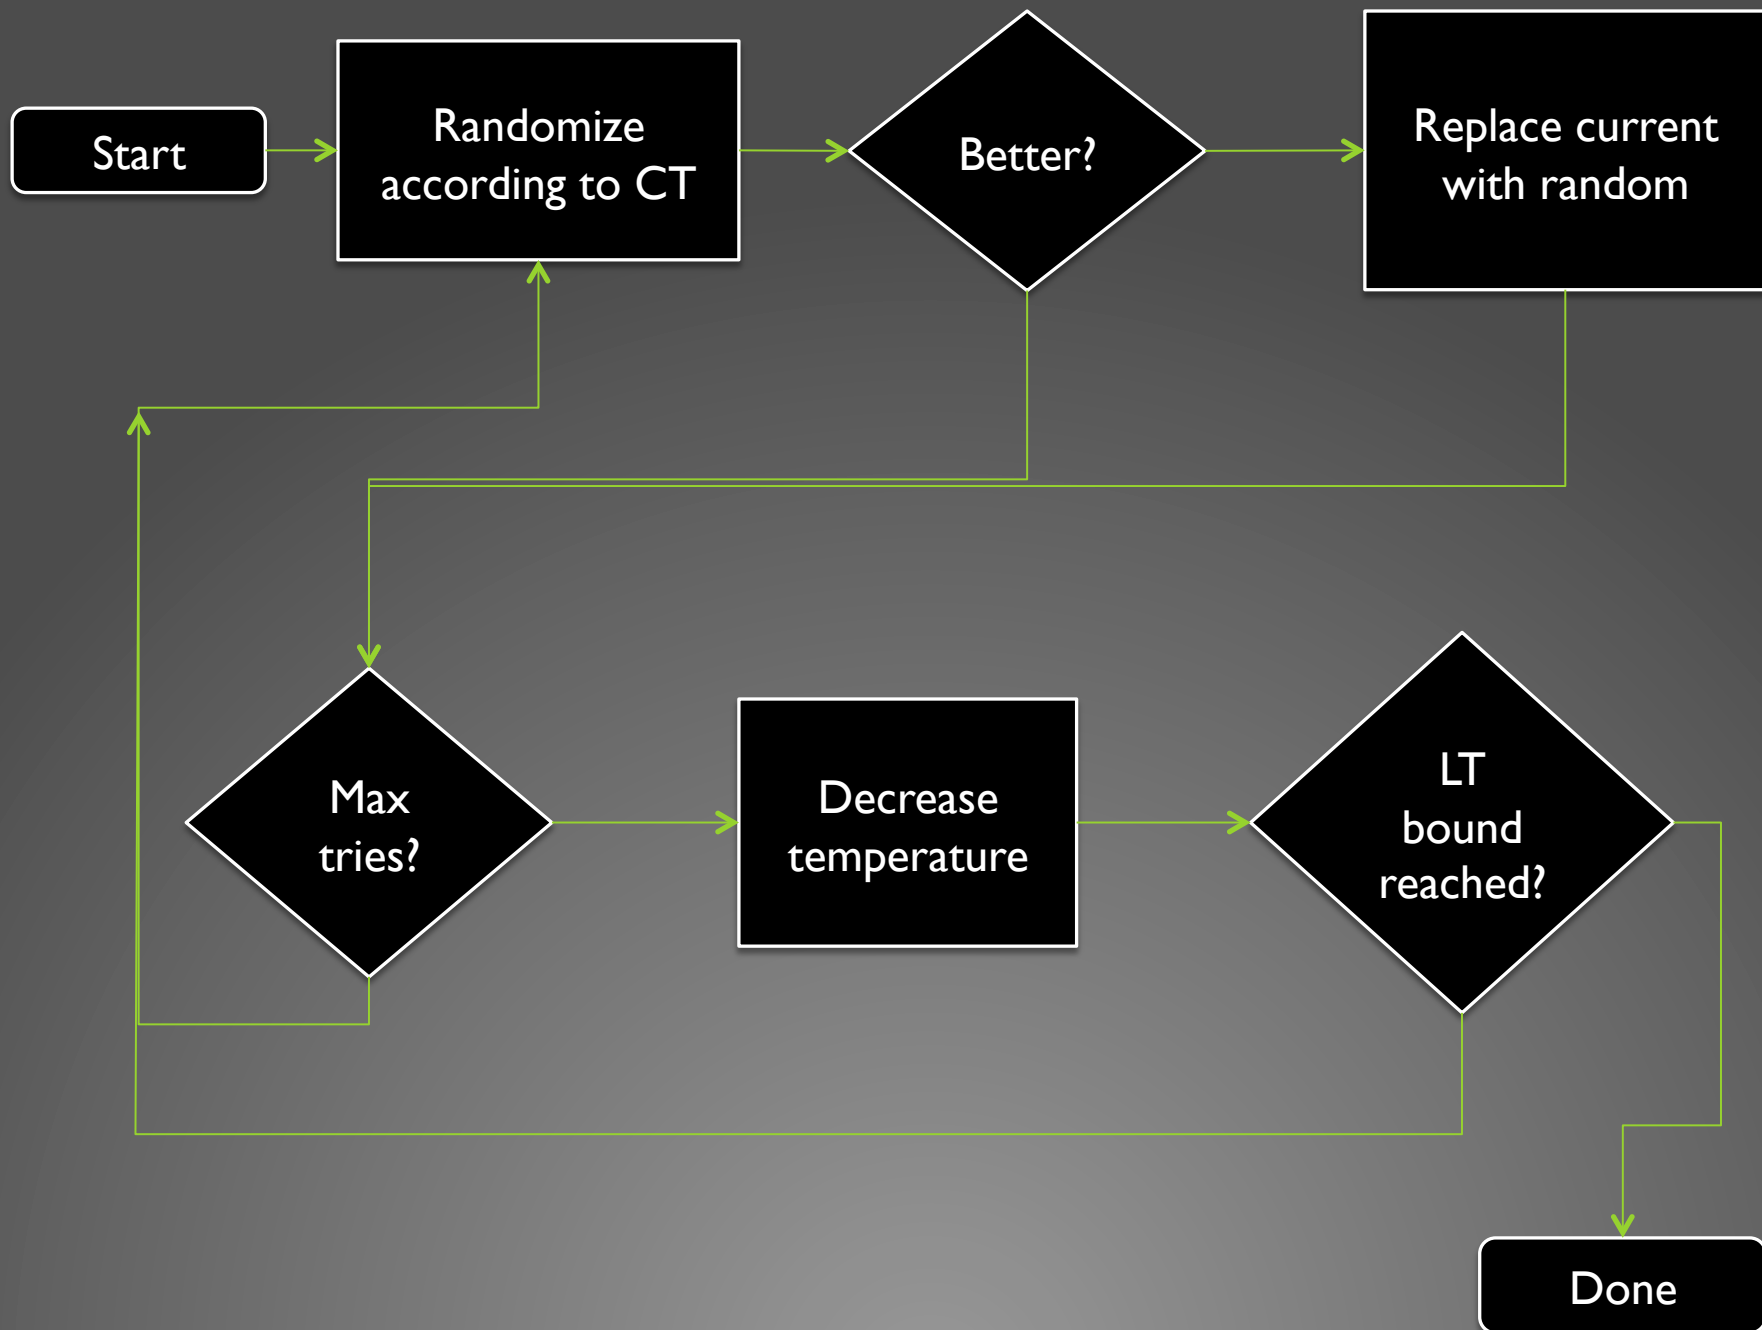

MORE KEY POINTS

- ▶ Simulated Annealing can make less than optimal choices
- ▶ No single algorithm

ALGORITHM

Given: initial state s_0 , maximum iterations $\max K$, maximum allowable energy $\max \text{Energy}$

```
state  $\leftarrow$   $s_0$ ; energy  $\leftarrow$  calculateEnergy(state);  
bestState  $\leftarrow$  state; bestEnergy  $\leftarrow$  energy  
k  $\leftarrow$  0  
while k <  $\max K$  and energy >  $\max \text{Energy}$   
    newState  $\leftarrow$  neighbor(state); newEnergy  $\leftarrow$  calculateEnergy(newState)  
    if newEnergy < bestEnergy then  
        bestState  $\leftarrow$  newState; bestEnergy  $\leftarrow$  newEnergy  
    if  $P(\text{energy}, \text{newEnergy}, \text{temp}(k/k_{\max})) > \text{random}()$  then  
        state  $\leftarrow$  newState; energy  $\leftarrow$  newEnergy  
    k  $\leftarrow$  k + 1  
return bestState
```

TEMPERATURE

- The key to the whole algorithm

$$e^{-\Delta D/T} > R(0,1)$$

USES

- ▶ Traveling Salesman Problem (TSP)
- ▶ N-Queens Problem
- ▶ Knapsack Problem
- ▶ ...

TRAVELING SALESMAN

- ▶ Simple problem
 - ▶ A salesperson is trying to visit a set of cities
 - ▶ For maximum profit, he needs to save gas money

TSP USES

- ▶ Route Optimization
- ▶ Manufacturing
 - ▶ Drilling
 - ▶ Welding
- ▶ Astronomy
